How Clean are Your Floors?

Your floors are most likely one of the main sources for cross-contamination of pathogens.

More than 1.7 Million Hospital Acquired Infections (HAI) occurred in hospitals in the United States in 2002, resulting in 99,000 Deaths.

- Average Hospital Acquired Infection cost per patient is \$23,735.
- Total cost of \$40.3 billion representing 11% of total hospital spend in 2009.

According to the CDC

1 IN 30 U.S. patients will contract at least 1 Hospital Acquired Infection during the course of their hospital stay. The need to improve infection control, and improved cleaning practices is at an all time high.

Square Scrub set out to improve the traditional way of cleaning with Disposable Microfiber Mops.

While traditional microfiber mop handles work, they do not compare to the **superior cleaning power** of the Square Scrub Doodle Mop.

Not all floors are created equal. Traditional mop heads struggle getting into hard to reach textures and crevasses. The Doodle Mop by Square Scrub allows you to superbly clean all flooring types. No machine on the market today has the superior soil removal like the Square Scrub Doodle Mop.

Using the Square Scrub Doodle Mop along with the disposable microfiber pad provides the most effective cleaning tool available on the market today. Square Scrub technology will help **drastically reduce the chances of cross-contamination**, reduce Hospital Acquired Infections, and allow for superior soil removal.
